

Finding patterns in Steam data

Proposed by Louise McMillan, 2025

This project is about finding patterns in publicly available data on Steam game purchases:

<https://www.kaggle.com/datasets/artermiloff/steam-games-dataset>

The data was obtained by web scraping via the public Steam API. The data includes various features of each game, such as the genre, the number of positive and negative reviews, any age restrictions, the number of hours of play time, etc.

Note that there are 4 datasets available. Students are expected to primarily use the cleaned March 2025 data, but it may be interesting to also obtain the May 2024 data and compare the two datasets.

Students will need to

- Explain the meaning of any game jargon
- Carry out an exploratory analysis, choosing a subset of variables and features to report
- Carry out the analyses required to answer specific questions, and display the chosen model(s) and results
- Consider any ethical aspects when reporting the results
